

MICROWAVE SOLIDS FLOW SENSOR **MWS-DP-3-24C**

With high penetrability of buildup material on the sensing head, this sensor can detect moving material such as powders, granules, etc. by utilizing the Doppler effect.

**Equipped with a sensitivity margin indicator
and a filter for screening unnecessary
incoming Doppler signals**

WADECO CO.,LTD.

MICROWAVE SOLIDS FLOW SENSOR MWS-DP-3-24C

General

The MWS-DP-3-24C Microwave Solids Flow Sensor detects moving solids utilizing microwave high penetrability and the Doppler effect.

The sensing head transmits microwaves toward the target material. A portion of the microwaves are reflected back to the sensing head and analysed as to whether they are from a moving or stationary object. The highly-penetrable microwave passes through a buildup on the head and even through pipe made of non-conducting materials such as plastics. It is best suited for detecting such materials as powders, granules, etc, moving through a vacuum pipeline.

Penetrability / Doppler effect of microwaves

When microwaves transmitted through the air encounter an object, some will be reflected, some absorbed and the rest will pass through the object.

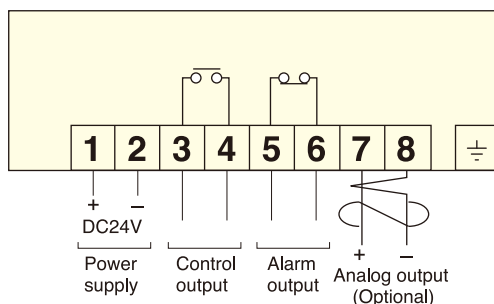

The amount of microwaves that pass through the object depends on the composition of the object encountered.

Generally speaking, microwaves cannot penetrate metals and are reflected; water absorbs the most microwaves.

Microwaves can easily pass through plastics, glass, ceramic, paper etc.

On the other hand, when microwaves are transmitted and reflected back to the sensor from a moving object, a frequency shift is generated between the transmitted and the reflected waves by means of the Doppler Principles, which is converted to a motion signal and actuated an output relay.

Wiring

Selection of detection mode and relay configuration

Detection mode	Flow	Non-flow	Alarm
Terminal number	3-4		5-6
Unpowered state	Open	Open	Close
Powered state	Non-detecting state	Open	Open
	Detecting state	Close	Close

Features

• High penetration

Easily penetrates process buildup on antenna, firebrick, refractory etc.,

The sensor can be installed on the exterior of a plastic or ceramic pipe and detect the flow of the material in the pipe.

• Non-intrusive installation

Mounted flush, no intrusion or damage to material flow.

• Equipped with a filter for screening unnecessary incoming Doppler signals

This function eliminates unnecessary incoming Doppler signals such as, signals from a vibrating pipe or conveyer and improves the S/N ratio.

This enables the sensor to be used in places where previously, non-contact flow detection was hardly possible.

• Equipped with a sensitivity margin indicator

The received power level and the sensitivity set point are indicated on the sensor allowing for easy visual adjustment and maintenance of the sensor.

The indicator clearly displays the advantage of the filter screening effect.

• Equipped with an alarm output

Microwave circuit failure and rising temperature can be detected and output.

• Selectable detection mode

Either flow or Non-flow detection mode may be selected.

• Equipped with a test button

LED indicators indicate microwave circuit status and internal temperature when the test button is pushed.

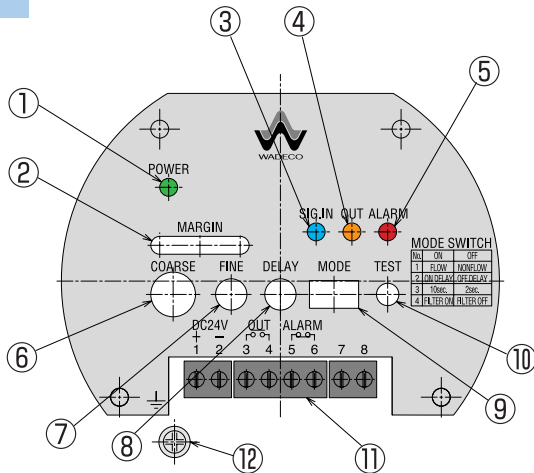

• Equipped with a Doppler signal incoming indicator

An LED indicator turns on when the Doppler signal is received. Flow and non-flow conditions are clearly displayed.

• Analog output (Optional)

The Doppler signal receiving power is output as an analog current.

Function of Switches, Indicators and Rheostats

No.	Part Name	Description
1	Power indicator	Green when power is on
2	Sensitivity margin indicator	Indicates sensitivity margin for nonflow and flow conditions
3	Signal incoming indicator	Blue when doppler signal is received
4	Output indicator	Orange when flow or non-flow is detected
5	Alarm indicator	Red when alarm is output
6	Coarse sensitivity rheostat	For sensitivity adjustment
7	Fine sensitivity rheostat	For fine sensitivity adjustment
8	Delay time rheostat	Delay time to detection output
9	Mode switch	Selects detection mode Factory adjustment 1:ON 2:OFF 3:ON 4:OFF
10	Test button	Transmission halt, signal incoming condition and temperature are indicated when the test button is pushed.
11	Terminals	
12	Earth terminal	

Sensitivity adjustment

After finishing the installation and wiring, check the following and adjust the sensitivity.

- Upon turning on the power supply, the power light ① POWER (Green) will turn on.
- Turn the delay time rheostat ⑧ counter-clockwise to set it at the minimum point.
- Turn the coarse sensitivity rheostat ⑥ fully clockwise to set it at-maximum. Next, turn the fine sensitivity rheostat ⑦ fully counter-clockwise to set it at minimum.
- Confirm the output indicator ④ OUT (orange) is off while operating the pipeline with an empty condition. If the output indicator ④ OUT (orange) is on, turn the coarse sensitivity rheostat ⑥ counter clockwise slowly and find the point where the output indicator ④ OUT (orange) turns off. This is the actuating point for the non-flow condition.
- While operating the pipeline with a continuous flow to be detected, you can see the output indicator ④ OUT (orange) turn on. Turn the coarse sensitivity rheostat ⑥ further counter clock wise slowly and find the point where the output indicator ④ OUT (orange) turns off. This is the actuating point for the flow condition.
- Set the coarse sensitivity rheostat midway between the actuating point for the non-flow condition and the actuating point for the flow condition. This is the sensitivity set point. The margins from the flow and non-flow actuating points to the sensitivity set point can easily be seen by viewing the sensitivity margin indicator ②. Vibration and surrounding noise from other machinery such as conveyers etc, will sometimes increase receiving power levels in the non-flow condition and result in unwanted detection. You can use the filter function to increase the margins and avoid any unwanted detection by turning on the mode switch No.4 ⑨ and repeating adjustment procedures (steps 4 to 6).
- In order to detect a sporadic flow, set the continuous detecting limit with the delay time rheostat ⑧
- In order not to detect a sporadic flow, set the non-detecting limit with the delay time rheostat ⑧ after turning on the mode switch No.2 ⑨.

Specifications

Type	MWS-DP-3-24C
Detecting method	Utilizes the Doppler Principle for detecting moving material
Power supply	DC24V $\pm 10\%$
Power consumption	2W
Operating distance	Up to 1.5m (Depending on material)
Frequency/Transmitting power	Approx. 24GHz, less than 100mW E.I.R.P.
CE indication	Complies with all EEC directives for use in heavy industrial environment (R&TTE to EN300440-1/2, EMC to EN301489-1/3 & EN61000-6-2, LVD to EN60950-1)
Sensitivity margin indicator	Displayed by 7 LEDs
Control output	DC50V, 150mA, 1a noncontact output
Alarm output	DC50V, 150mA, 1b noncontact output (Microwave circuit failure and rising temperature)
Delay function	ON/OFF delay (Selectable), 0 ~ 10sec. / 0 ~ 2sec. (Selectable)
Delay time from power on to function	Approx. 8 seconds
Doppler signal incoming indicator	Blue LED
Mode selection	NO.1:Flow/Non-flow detection NO.2:On/Off delay NO.3:Delay time, 10SEC./2SEC. NO.4:Filter, On/Off
Test function	Microwave circuit status and sensor's temperature are indicated by LED when the test button is pushed.
Vibration resistance	10 ~ 55Hz, 0.75mm single amplitude in X, Y and Z directions, for 2 hours each
Operating ambient temperature	-20°C to +55°C
Non-functioning temperature	-30°C ~ +70°C
Continuous maximum pressure	0.5MPa
Enclosure rating	IP65 equivalent
Enclosure construction	Diecast aluminium
Color	Metallic silver grey
Weight	1.2kg

Installation

Notes:
Apply liquid sealant into
screw hole and/or any gaps.
Equipped with an SUS nut.
Flange mounting is also available.
