## 1. BASIC CONSTRUCTION

Structure of an electrolytic aluminum capacitor is shown hereunder:

1. Anode : aluminum foil
2. Dielectric : aluminum oxide
3. Papers spacers impregnated with electrolyte
4. Ionic conduction assumed by electrolyte
5. Cathode : aluminum foil

The positive plate is an etched aluminum foil covered with alumina which is the dielectric of the capacitor.

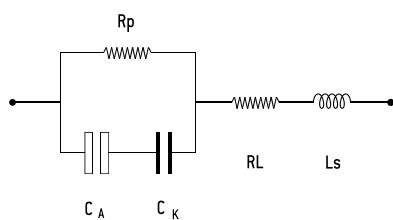

The negative plate is constituted by a second aluminum foil which serves as a current supply, and by electrolyte-impregnated papers layers.

The metal used for anode is a  $\geq 99,98\%$  grade aluminum.

The dielectric has a thickness of  $13 \text{ \AA/V}$ .

The aluminum used for the cathode is a  $\geq 98\%$  grade aluminum covered with a dielectric layer with a thickness of about  $40 \text{ \AA}$ .

## 2. DIAGRAM OF THE EQUIVALENT CIRCUIT

$C_A$  = Capacitance of the anode

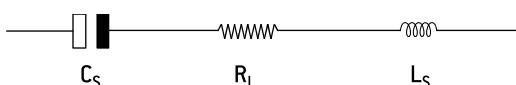

$C_K$  = Capacitance of the cathode

$R_p$  = Parallel resistance due to the aluminum oxide films.

$R_L$  = Series resistance of connections, plates and impregnated spacer.

$L_s$  = Inductance of winding and connections.

A standard simplified diagram is:

$C_s$  is the series capacitance of both anode and cathode capacitances.

Electrolytic aluminum capacitors are naturally polarized because of the insulating film on the anode. Given the very thin aluminum oxide layer, a reversed voltage should not exceed 1.5 V when there is energy supply.

Short duration reverse voltages can be absorbed by special construction, second anode replacing the former cathode.

## 4. ELECTRICAL CHARACTERISTICS

### 4.1. RATED CAPACITANCE $C_R$

The rated capacitance is defined at 100 Hz and at ambient temperature.

### 4.2. RATED VOLTAGE $U_R$

$U_R$  is the maximum DC voltage which may be applied in continuous operation.

When applying a superimposed alternating voltage, the peak value of the resulting waveform should not exceed the rated voltage.

### 4.3. PEAK VOLTAGE $U_p$

$U_p$  is the maximum repetitive voltage which can be applied within short periods. Defined in CECC 30 300 and IEC 60 384-4 :

1000 cycles of 30 s charge followed by a no load period of 5 min. 30 s with upper category temperature.

$U_p \geq 1,15 U_R$  ( $U_R \leq 315$  V)

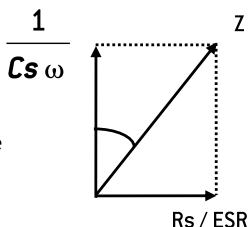

$U_p \geq 1,10 U_R$  ( $U_R > 315$  V)

## 4.4. DISSIPATION FACTOR TAN $\delta$

The dissipation or loss factor is defined by its tangent Tan $\delta$

$$Tg\delta = R_s C_s \omega \quad (\omega = 2\pi F)$$

**ESR** Capacitor Equivalent Series Resistance  
**C<sub>s</sub>** Capacitor capacitance  
**F** Frequency (100 Hz)  
**Z** Capacitor impedance

## 4.5. EQUIVALENT SERIES RESISTANCE ESR

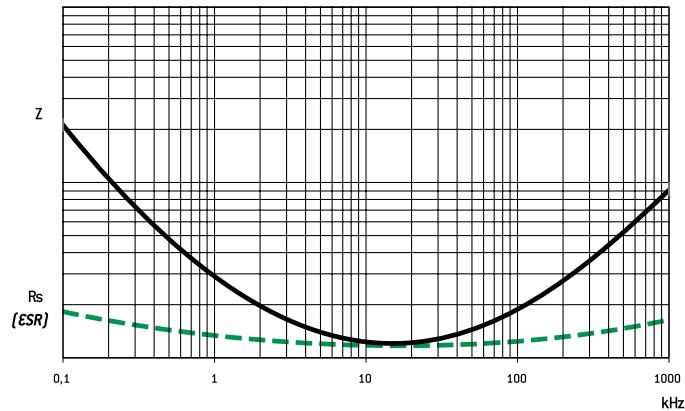

The relation between ESR and dissipation factor Tan $\delta$  is given in § 4.4.

## 4.6. IMPEDANCE Z - INDUCTANCE L

The impedance is given by :

$$Z = \sqrt{R^2 + (L\omega - \frac{1}{C\omega})^2}$$

L inductance. Generally L = 5 to 20 nH

Z and ESR as function of frequency typically follows the chart :

## 4.7. PERMISSIBLE RIPPLE CURRENT (I r.m.s.) I<sub>r</sub>

The current is defined at the maximum climatic category and at 100 Hz. It is the root mean square value r.m.s. The value I<sub>0</sub> is the rated value for calculations of expected life up to 3 I<sub>0</sub>.

## 4.8. LEAKAGE CURRENT II

I<sub>l</sub> is measured at 20°C after a 5 min. polarization under rated voltage.

For C<sub>R</sub> in  $\mu$ F and U<sub>R</sub> in V :

I<sub>l</sub>  $\leq$  0,01 C<sub>R</sub> U<sub>R</sub> or 1  $\mu$ A\*

when C<sub>R</sub> U<sub>R</sub>  $\leq$  1000  $\mu$ C

I<sub>l</sub>  $\leq$  0,006 C<sub>R</sub> U<sub>R</sub> + 4  $\mu$ A

when C<sub>R</sub> U<sub>R</sub> > 1000  $\mu$ C

For U<sub>R</sub> > 350 V<sub>DC</sub> it can be specified :

with K = 4, 6 or 8

or

I<sub>l</sub>  $\leq$  0,3 (C<sub>R</sub> U<sub>R</sub>)<sup>0,7</sup> + 4  $\mu$ A (CECC 30 300)

## 5. SPECIFICATION TO APPLY

Electrolytic aluminum capacitors are defined in :

- NF and UTE French national standard
- CECC European specifications
- IEC international specifications

Quality insurance procedures are described in these specifications.

105°C		•	•	•
85°C	•	•	•	•

Standard endurance tests do not exceed 2000 hours at 125°C. However, present EXXELIA<sup>SIC SAFIC</sup> technologies concerning liquid electrolytes have led to endurance tests up to 5000 hours at 125°C (PRORELSIC 125 - FELSIC 125 RS) and even 20000 hours at 125°C (PRORELSIC 145 - ALSIC 145)

### 6.2. PERFORMANCE REQUIREMENTS ON STANDARD ENDURANCE TESTS.

Permissible capacitance drift  $\Delta C/C$  (%)

Permissible increase factors on Tanδ, ESR, Z and II initial values

$U_R$	Endurance test

Tanδ or ESR [1]	1,5	1,3	1,3	1,5
Z [2]	3	2	2	3
II	Standard values			

[1] Tanδ or ESR : for initial value, take standard value.

[2] Z : for initial value, take specified value (see data sheet).

Specific requirements can be taken into consideration with regards to initial values of dissipation factor or equivalent series resistance and impedance.

## 6.3. FAILURE CRITERIA FOR ELECTROLYTIC CAPACITORS.

Failure criteria are defined in CECC 30 301

- Non measurable defaults leading to complete failure.
- Measurable defaults leading to adjustment losses of the load circuit (failure due to variations).

### 6.3.1. Non measurable defaults.

They might be summed up as :

- Open circuit
- Short circuit
- Operation of pressure relief device
- Severely damaged insulation
- Unusable terminations

### 6.3.2. Measurable defaults.

Variations exceeding the values given below characterize a default.

- Capacitance drift  $\Delta C/C$  (%) : 3 times the limit for standard endurance testing or 50% (whichever is the smallest).
- Tanδ or ESR : 3 times standard max initial values.
- Z : 3 times standard max initial values.
- II : initial limit (under load conditions).

Specific requirements can be taken into consideration with regards to lower drifts.

## 6.4. INFLUENCE OF MAIN PARAMETER ON OPERATIONAL LIFE.

### 6.4.1. Temperature.

The capacitors operational life is highly dependent upon its internal temperature  $\Theta_i$  and therefore upon the ambient temperature and the ripple current.

Knowing ESR and dissipated power values (§ 6.4.3.) one can figure out, the internal temperature rise and then determine the capacitors expected life.

With present high boiling point electrolytes (§ 8.6)

$\Theta_{i\max} = 125$  to  $185^\circ\text{C}$  depending on styles.

### 6.4.2. Ripple current.

The ripple current flowing through the capacitor increase the internal temperature through power dissipation.

Standards define the permissible current at 100 Hz and generally consider a temperature rise of 5 to  $10^\circ\text{C}$  of max category temperature.

Current waveforms and frequencies make it difficult to clearly determine the capacitors internal temperature rise, which defines the operationally life.

Experiments confirm following relationship :

$$\Theta_i = \Theta_a + (\Theta_c - \Theta_a) K$$

Where :

- $\Theta_i$  = Internal hot spot temperature
- $\Theta_a$  = Ambient temperature
- $\Theta_c$  = Case temperature
- K = Parameter depending upon case diameter and cooling

$$0 \geq 51 K = 2^{\pm 0,5}$$

$$0 < 51 K = 1,5^{\pm 0,5} \quad (\text{air cooling - } 0,2 \text{ m/s})$$

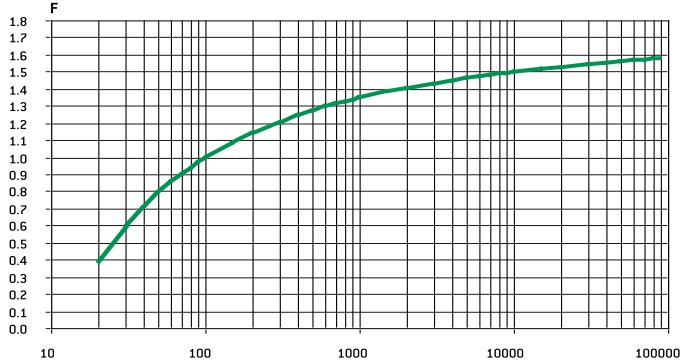

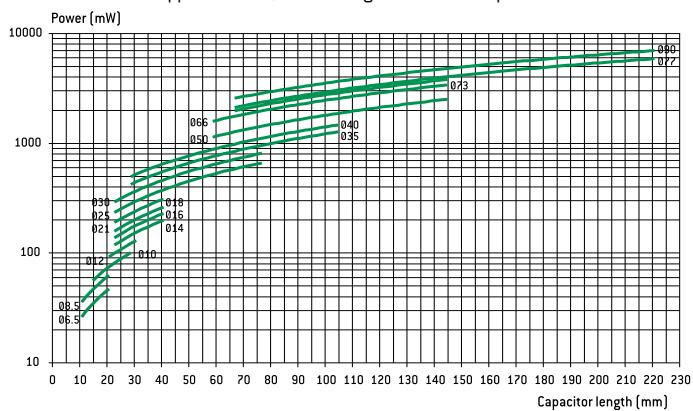

# General technical data

r.m.s. value according to current waveform.

Function	Mean value	R.m.s. value	Function	Mean value	R.m.s. value	Function	Mean value	R.m.s. value
	$A (t_0/T)$	$A \sqrt{t_0/T}$		$A/2$	$A\sqrt{3}$		$2A/\pi$	$A/\sqrt{2}$
	$A (t_0/T)$	$A\sqrt{2t_0/3T}$		$2A/\pi (t_0/T)$	$A\sqrt{t_0/2T}$		$A/2$	$A/\sqrt{3}$
	$A/2 (t_0/T)$	$A\sqrt{t_0/3T}$		$A/2 (t_0/T)$	$A\sqrt{t_0/3T}$		0	A

### 6.4.3. Dissipated power versus case dimension

For calculations of ripple currents, considering an internal temperature rise of 10°C

$$P = ESR \cdot I^2$$

P = Dissipated power (mW)

$$(\Theta_i - \Theta_a = 10^\circ C)$$

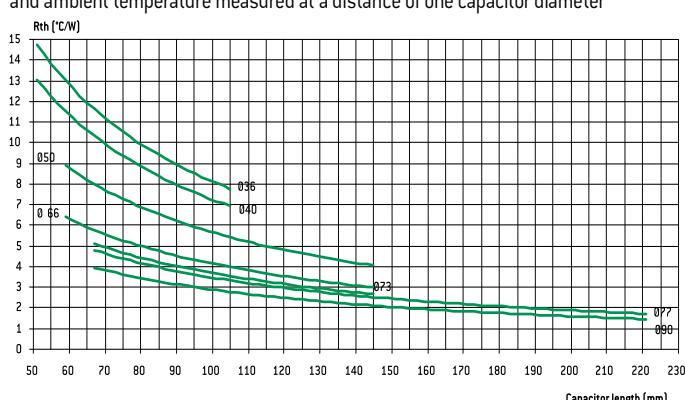

ESR : Equivalent series resistance (100 Hz 20°C)

I : Ripple current (r.m.s. value at 100 Hz)

For different frequencies from 100 Hz, I must be multiplied by the factor F, according to above chart. :

### 6.4.4. Thermal resistance Rth and air cooling

Rth is static thermal resistance [without cooling] between capacitor central hot spot and ambient temperature measured at a distance of one capacitor diameter

Forced or not cooling air can lead to a significant decrease of these values.

Consequently, r.m.s. ripple current can be increased as a function of air cooling speed :

$\theta$ (mm)	$\leq 0,5$ m/s	1 m/s	2 m/s	3 m/s	$\geq 4$ m/s
66 - 90	I~	1,1 I~	1,2 I~	1,25 I~	1,3 I~
36 - 51	I~	1,2 I~	1,4 I~	1,45 I~	1,5 I~

This parameter shall be applied to one capacitor alone.

For capacitors in bank, ambient temperature must be strictly equal around all capacitors.

### 6.4.5. Quality guaranty

We guarantee products manufactured during 2 years from the date of shipment against defaults of material and assembly.

This guaranty can be involved by the buyer only if our products are used within normal conditions, always according to the state of the art and taking in account storage conditions.

The equipment design should take into consideration possible failures of our capacitors and related effects in order to avoid them.

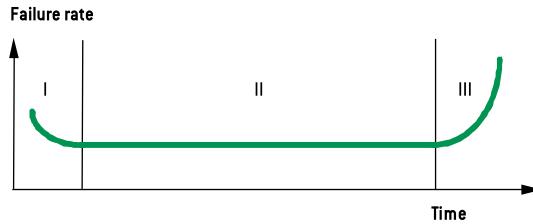

Guaranty is not applicable for damages occurred by surge voltage, irregular use, polarity inversion or maintenance default.

Guaranty is exclusively limited to the replacement of individual defective capacitors within the terms of delivery. This rule applied to all cases and particularly to any further consequence of failures.

### 6.4.6. Reliability

Failure rate :

$$FR = \frac{\text{Number of components tested} \times \text{test duration}}{\text{Number of failures}}$$

Failure rate is measured in FIT (failure in time =  $10^{-9}$  / hour).

The failure rate is set up during the life time of the capacitor (phase II).

I. Early failure phase (generally excluded during ageing process).

II. Operational life time of the capacitors

III. End of life

## 8. INFORMATION ON APPLICATION

### 8.1. CLEANING SOLVENTS

Use aliphatic alcohols, such as denatured ethyl alcohol, isopropanol, or butylacetate, or else alkaline diluted solutions. Avoid incompatible solvents (halogenous for example).

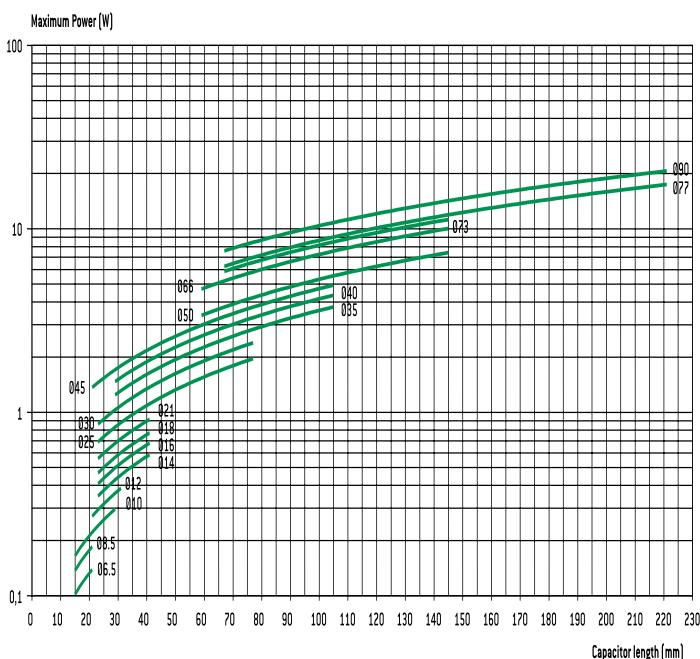

### 8.2. SHELF LIFE

There is no electrical characteristics variation for long periods of storage except leakage current which can increase.

It is caused by chemical reactions between the dielectric alumina and the electrolyte. These reactions are reversible when switched on. Capacitors can generally be stored at temperature between -5° and +50°C without reforming for the following periods of time :

- For  $U_R \leq 100$  V, storage time : ..... 5 years (up to 10 years under specific conditions)
- For  $100 < U_R \leq 360$  V storage time : ..... 3 years
- For  $360 < U_R < 500$  V storage time : ..... 1 year
- For  $U_R \leq 500$  V, storage time : ..... 6 months

Generally when these periods are overstepped, one hour at rated voltage causes the decrease of leakage current under the specified limits. An other way to avoid this leakage current increase problem is to always limit available power through capacitor during first seconds or minutes after storage or transport, according to the following chart :

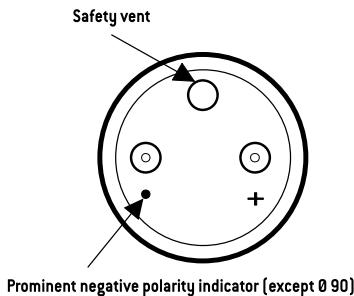

### 8.3. LOW PRESSURE RESISTANCE

EXXELIA SIC SAFCO capacitors can be used with ambient low pressure decreasing up to 10 mbar (altitude 28000 m – 92000 feet).

### 8.4. MOUNTING SCREW TERMINALS CAPACITORS (FELSIC)

Capacitors may be used vertically (terminals on top) or horizontally. When used horizontally, the following position in relation to the safety vent, is recommended :

Mounting capacitors in series may be used for operating voltage exceeding  $U_R$ . See FELSIC in bank

Prominent negative polarity indicator (except 0.90)

### 8.5. MOUNTING SOLDER TYPE CAPACITORS.

They may be used in any position. During mounting, avoid applying excessive force to capacitor pins or wires. There is a risk of damaging internal connections.

After soldering and for the same reasons, do not try to move the capacitor's body.

### 8.6. ELECTROLYTES : SAFETY RULES.

Electrolytes used in EXXELIA SIC SAFCO capacitors are manufactured by EXXELIA SIC SAFCO. Main solvents are generally γ butyrolactone and ethylene glycol, very stable high boiling point solvents. Ionic conductive salts in electrolyte induce a very weak acidity (pH 5 to 7).

### 8.7. ENVIRONMENT.

- There is no possibility to produce gaseous emissions of nitrogen oxides or liquid emissions of nitrites or nitrates during the manufacture process.
- There is no possibility to produce liquid emissions or salts coming from dangerous metals such as mercury, hexavalent chromium or cadmium and from poisons such as arsenic or cyanides.

Accessories not made in aluminum, ring, screw, are also plated in anticorrosion processes without cadmium.

EXXELIA SIC SAFCO is always involved in this security field particularly in using whenever it's possible chemicals for electrolyte, without well-known risks.

- Dimethylformamide (DMF) dangerous solvent forbidden in several uses is completely excluded by EXXELIA SIC SAFCO, since 1990.
- There is no halogen compound such as chlorofluorocarbon (CFC or FCKW in german) or polychlorobiphenyl (PCB-Pyralene) or pentabromodiphenylether or octabromodiphenylether.

There is neither benzene, toluene or phenyl compound nor explosive such as picric acid, nor asbestos in plastic covers.

All the capacitors made by EXXELIA SIC SAFCO since 1991, can be scrapped or used in raw materials recycling processes without special care.

EXXELIA SIC SAFCO aluminum capacitors with non solid electrolyte are particularly suitable for different kinds of environment taking in account severity increasing laws.

European directives 2003/11/EC, 2002/96/EC (WEEE) and 2002/95/EC (RoHS) applies to all EXXELIA SIC SAFCO capacitors including every solder type, manufactured with pure tin coated pins or wires, since at least January 2006.

EXXELIA SIC SAFCO capacitors do not contain any carcinogen, mutagen and substance toxic for reproduction in accordance with 1907/2006/EC (REACH) European directive target.

**EXPECTED LIFE**

as a function of temperature and ripple current :

**EXPECTED LIFE WITH ID :**

- 1 to 5 discharges per minute For  $I = I_d$  48 000 000 cycles

- 10 discharges per minute For  $I = I_d$  36 000 000 cycles

- 15 discharges per minute For  $I = I_d$  18 000 000 cycles

$$I = I_d/2 > 1 \times 10^9 \text{ cycles}$$

- 15 to 60 discharges per minute

To have the highest dissipated power, use preferably FELSIC CAPAX 500 V and calculate r.m.s. current (general technical data § 6.4.2.).

In order to have the highest value of stored energy use preferably FELSIC CAPAX 305 V, 360 V, 410 V and 460 V (0.4 Wh/kg).

- Power electronics : converters, current inverters
- Switch mode power supplies
- Magnetization, welding machines, flash
- Circuit with high impulse current
- 360 V and 480 V series are mainly designed for repetitive fast discharges working.

Fixing : Clip or stud fixing

**EXPECTED LIFE**as a function of temperature and ripple current  
For  $U_R = 360$  V and 480 V do not overstep 0.95  $U_R$ **EXPECTED LIFE WITH  $I_D$  :**

- 1 to 5 discharges per minute For  $I = I_d$  48 000 000 cycles

In order to have the highest value of stored energy use preferably FELSIC 85 360 V.

- 10 discharges per minute For  $I = I_d$  36 000 000 cycles

- 15 discharges per minute For  $I = I_d$  18 000 000 cycles

$$I = I_d/2 > 1 \times 10^9 \text{ cycles}$$

- 15 to 60 discharges per minute

To have the highest dissipated power, use preferably FELSIC 85 480 V, 500 V and 550 V and calculate r.m.s. current (general technical data § 6.4.2.).

## APPLICATIONS

- For solid PC board mounting
- Switch mode power supplies
- Impulse current

Fixing : Printed SNAP-IN pins

Tolerance on capacitance at 20°C :  $\pm 20\%$   
Operating temperature :  $U_R \leq 250 \text{ V} : -55^\circ\text{C} + 105^\circ\text{C}$   
 $U_R \geq 350 \text{ V} : -55^\circ\text{C} + 85^\circ\text{C}$

## SPECIFICATIONS

CECC 30300 Long life  
DIN 41 240 - Climatic category and GPF: -55 + 105°C / 56 days  
IEC 60 384.4 long life

## RESISTANCE TO VIBRATIONS

Frequency : 10 – 500 Hz  
Displacement amplitude or : 0,75 mm  
Max acceleration : 10 g – 98 m/s<sup>2</sup>  
Duration : 3 x 10 sweep cycles

## WITHSTAND STRENGTH OF INSULATING SLEEVE

Insulation resistance at 20°C between pins and mounting hardware : 100 M $\Omega$   
Test voltage at 50 Hz 1 min. between terminals and mounting hardware : 2000 V  
Fire resistance : self extinguish 15 s (IEC 60 695-2-2)

## APPLICATIONS

- For solid PC board mounting
- Switch mode power supplies
- Impulse current

Fixing : Printed SNAP-IN pins

Tolerance on capacitance at 20°C : ± 20%  
 Operating temperature : - 55°C + 85°C

## SPECIFICATIONS

CECC 30301-811 Issue 1

DIN 41 240 - Climatic category GPF - 55°C + 85°C / 56 days  
IEC 60 384.4 long life

## RESISTANCE TO VIBRATIONS

Frequency	: 10 – 500 Hz
Displacement amplitude or	: 0,75 mm
Max acceleration	: 10 g – 98 m/s <sup>2</sup>
Duration	: 3 x 10 sweep cycles

## WITHSTAND STRENGTH OF INSULATING SLEEVE

Insulation resistance at 20°C between pins and mounting hardware : 100 MΩ.

Test voltage at 50 Hz 1 min between terminals and mounting hardware  
Fire resistance : self extinguish 15 s (IEC 60 695-2-2).

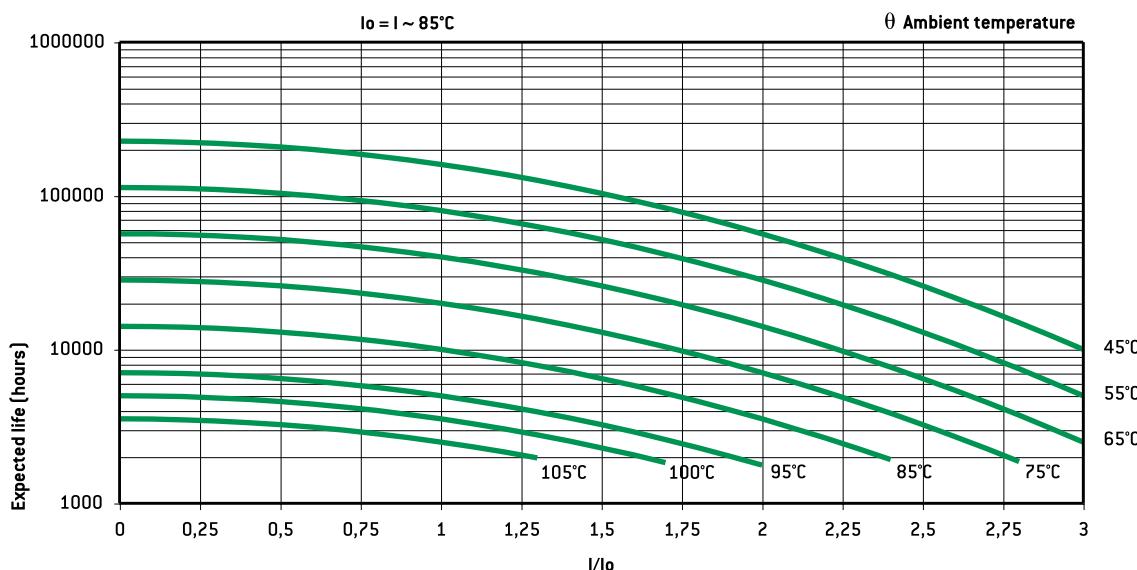

10 000 h / 85°C

NFC 83 110 - Model CO 52 - Long life

DIN 40040 FKD

DIN 41 257 - DIN 41 240

CECC 30 301-802 Issue 2

IEC 60 384.4 long life

Climatic category GPF: -55°C + 125°C / 56 days

Standard endurance test at U<sub>R</sub> = 2000 h / 125°C**WITHSTAND STRENGTH OF INSULATING SLEEVE**

Insulating resistance at 20°C between leads and mounting hardware : 100 MΩ

Test voltage at 50 Hz 1 min. between leads and mounting hardware : 1000 V

Fire resistance : self extinguish 30 s (IEC 60 695-2-2) without PVC.

- Coupling/decoupling
- Filtering
- Circuits with time constant
- Switch mode power supplies

Insulating aluminum case  
Axial tin-coated copper leads  
Welded chain providing perfect continuity of the circuit.

Tolerance on capacitance at 20°C :
